Forest Soils and CO₂

Rainer Baritz

Forest Soils and CO₂

Rainer Baritz

Project Background

CarboInvent (→ FP5 CarboEurope cluster)

Multi-source inventory methods for quantifying carbon stocks and stock changes in European forests (FP5)

EU Joint Research Centre

Data Quality System for greenhouse gas emissions and sinks

CarboEurope IP (→ FP6)

Work Package 4.2. Land Carbon Inventories (baseline for forest soil C)

IPCC Greenhouse Gas Inventory Programme

Good Practice Guidance LULUCF 2003

Forest Soils and CO₂
Rainer Baritz

EU Joint Research Centre

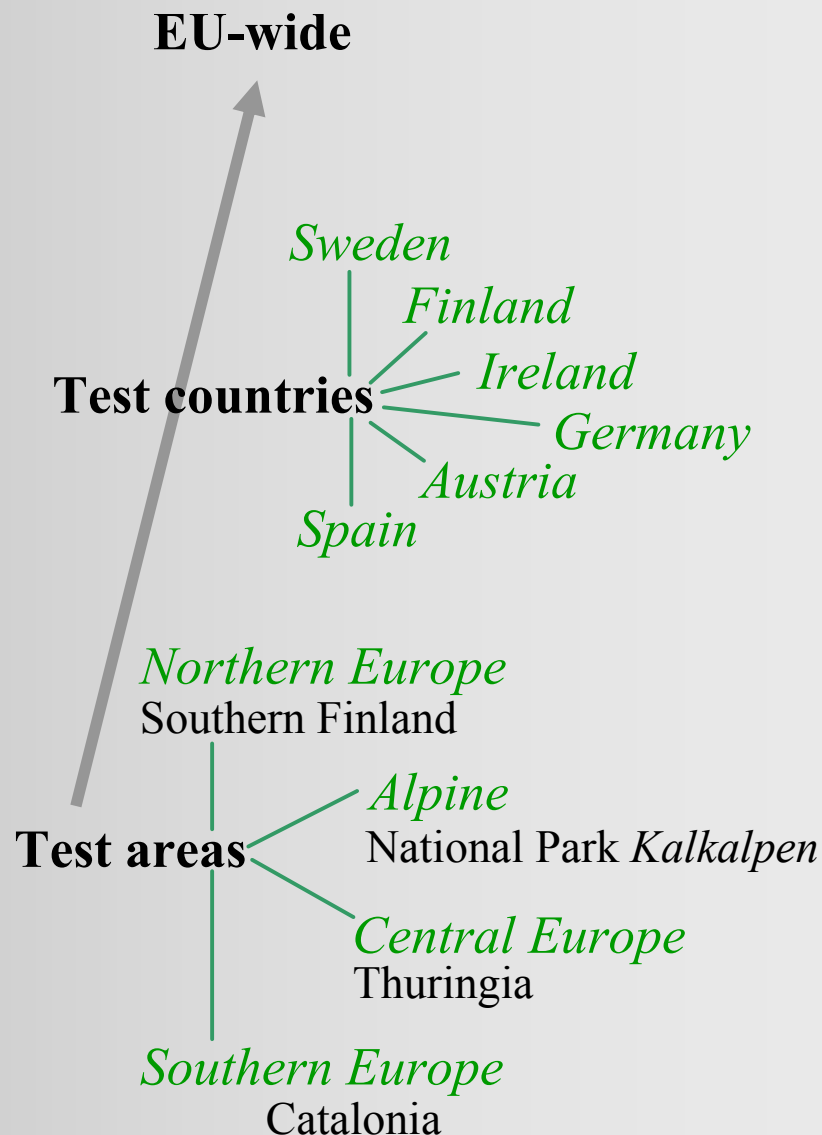

- QA/QC of EU GHG Inventory
- independent verification

CarboInvent

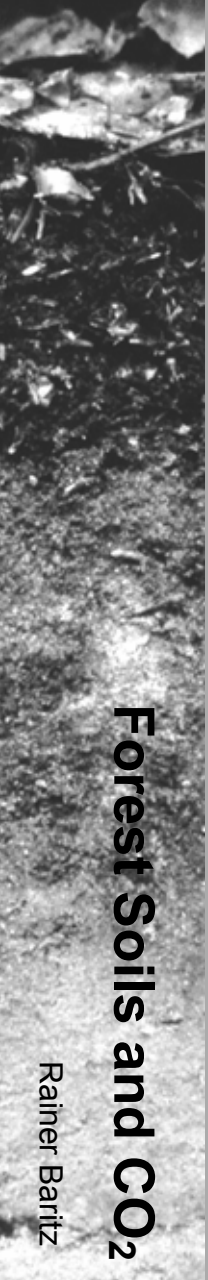

- Quantification of **regional soil C budgets** at various scales
- Assessment of plot level and regional-level **uncertainties**

CarboEurope IP

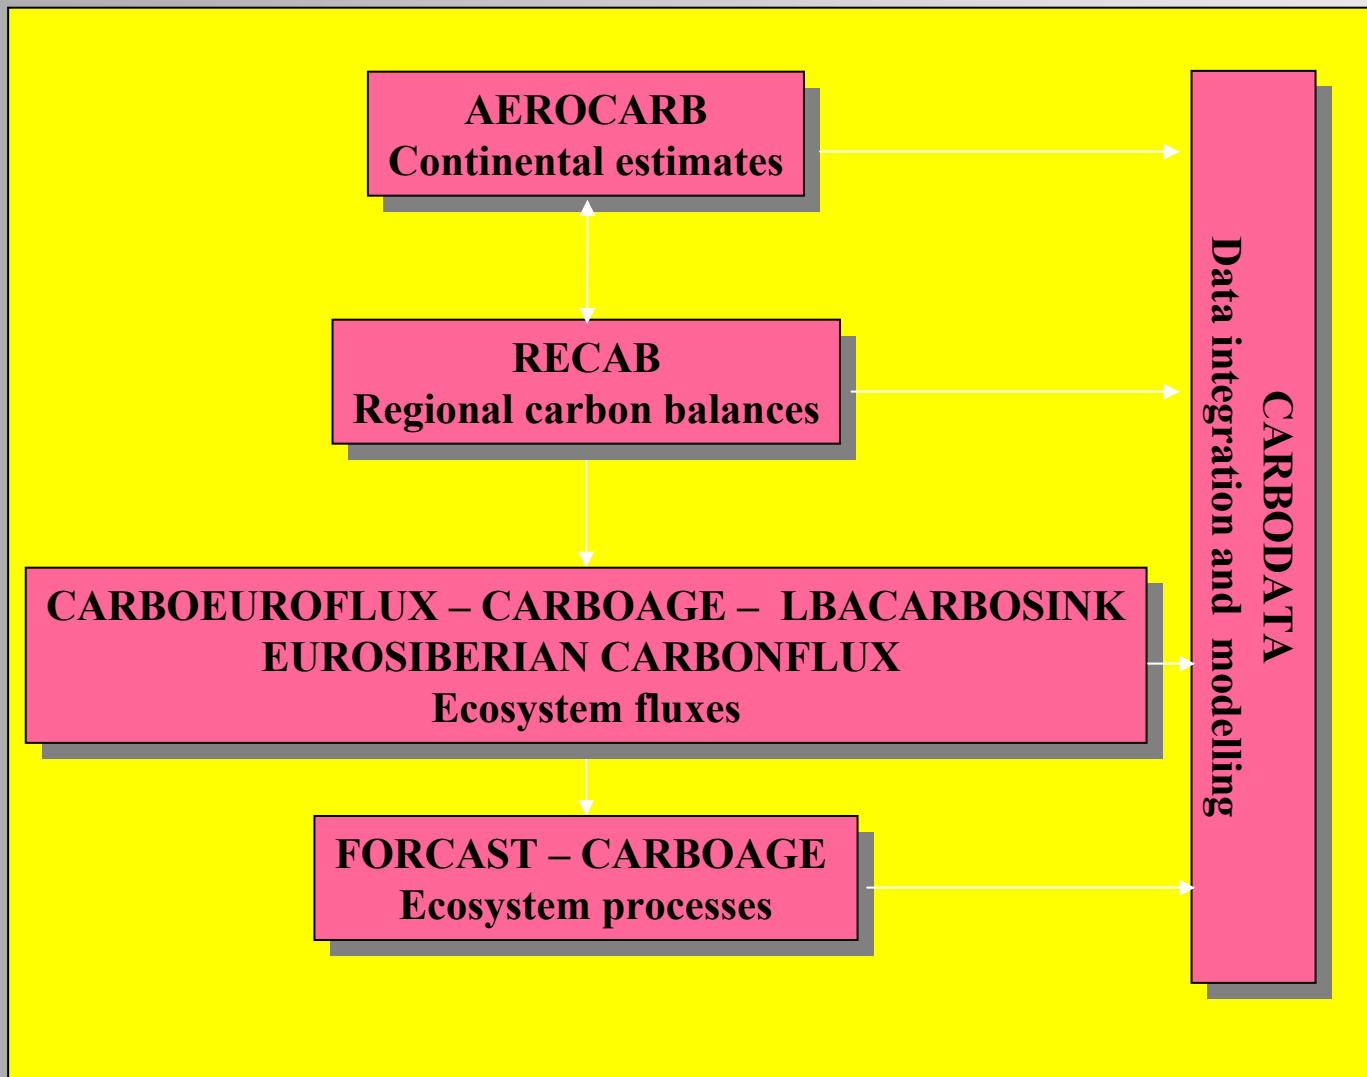

Forest Soils and CO₂

Rainer Baritz

CARBOEUROPE

Forest Soils and CO₂

C efflux

heterotrophic respiration

root respiration

C pool

litter¹⁾
woody debris

microbial biomass

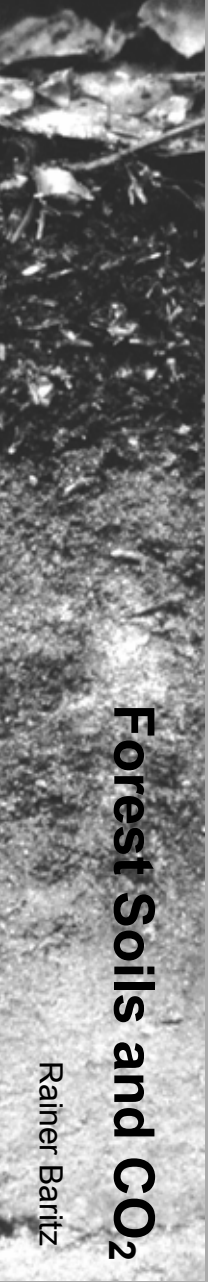

humus²⁾

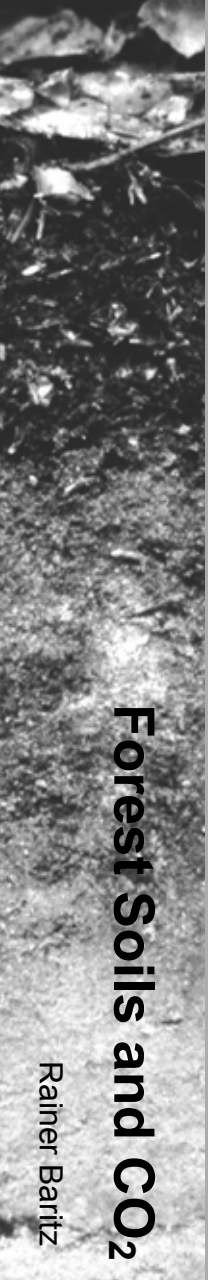

fine roots

coarse roots²⁾

- ¹⁾ plant residues of various decompositional stages incl. carcasses and faeces of soil animals
- ²⁾ humus: re-synthesized and stabilized organic compounds usually counted as standing tree biomass
- ³⁾

leakage of C_{org},
CO₂, HCO₃⁻

- 
- to measure fluxes...
(few sites)
 - to measure pools...
(more sites - depends on which pool/fraction)
 - to measure process drivers...
(frequent: basisdata for pedo- transfer functions, models, etc.)

Forest Soils and CO₂

Rainer Baritz

➤ to measure for which purpose ... ?

- 
- *C (N) cycle – sinks and sources for greenhouse gases*
 - *detecting the drivers (with regard to C dynamics) helps to identify positive and negative management effects, as a basis for setting political incentives*
 - *plot/process → landscape for regional/country-level estimates*

Forest Soils and CO₂

Rainer Baritz

➤ Global view

	80'ies	90'ies
atmospheric increase	3.3±0.1	3.2±0.1
emissions (fossile fuels)	5.4±0.3	6.3±0.4
ocean - atmosphere flux	-1.9±0.6	-1.7±0.5
land - atmosphere flux	-0.2±0.7	-1.4±0.7
a) land use change	1.7 (0.6 to 2.5)	not available
b) remaining terrestrial sink	-1.9 (-3.8 to 0.3)	not available
IPCC Third Assessment Report (TAR)	[PgC/a]	

➤ Soils

- **soils globally** contain two to three times more carbon than terrestrial biomass does (Bouwman 1990; Schlesinger 1990)
- high **uncertainties** exist about the contribution made by soils to the terrestrial carbon pool and carbon flux (Post et al. 1990; Dixon & Turner 1991).
- lack of knowledge/data and high uncertainties endanger the environmental integrity of the **Kyoto Protocol**

➤ Sink estimates for terrestrial carbon (LULUCF) in Europe

Background: Uncertainties

(1) EEA/ETC Air Emissions 1999; (2) Kauppi and Tomppo 1993; (3) Martin 1998; (4) Martin et al. 1998; (5) Schulze et al. 2000; (6) Nabuurs et al. 1997; (7) Kauppi et al. 1992; (8) Bousquet et al. 1999; (9) Kaminski et al. 1999; (10) Rayner et al. 1997; (11) Ciais et al. 1995

Data Need: Environmental Policy

Forest Soils and CO₂

Rainer Baritz

European Climate Change Programme

ECCP was established in June 2000 to help identify the most environmentally friendly and cost-effective measures enabling the EU to meet its Kyoto target

Working groups, relevant for soils:

- Forest related carbon sequestration

final report available at

<http://europa.eu.int/comm/environment/climat/forestrelatedsinks.htm>

- Carbon sequestration in agricultural soils

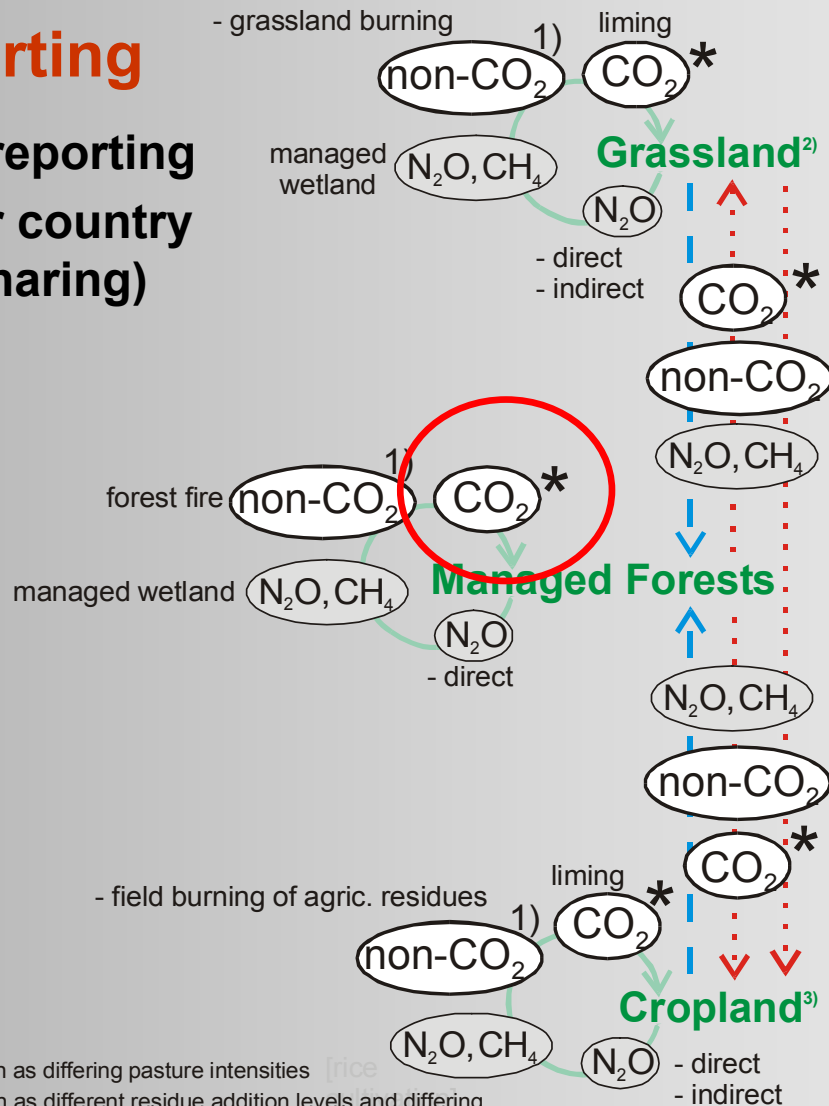

final report available at

<http://europa.eu.int/comm/environment/climat/agriculturalsoils.htm>

- The 8% reduction target for EU15 corresponds to 336 Mt CO₂eq
- Considering only activities with clearly positive environmental co-benefits (e.g., on soil protection, biodiversity), the technical potential for carbon sequestration by the 1st CP in 2010 is about 60-70 Mt CO₂eq for agricultural soils and 33 Mt for forests.
- 12 Mt will be achieved through reduced N₂O emissions (by-product of CAP reform and cross compliance with environmental legislation like nitrate directive)
- Globally, management of forests is expected to sequester carbon to offset 12-15 % of projected fossil fuel emissions (next 60 years; *Cannell 1995*)

➤ Political Reporting

Greenhouse Gas reporting
(UNFCCC, KP) per country
and EU (burden sharing)

* C Stocks in 5 Pools
above-ground biomass
below-ground biomass
dead wood
litter
soil carbon

¹⁾ non-CO₂: CH₄, N₂O, NO_x, CO (NMVOCs) ,

²⁾ includes agricultural management categories such as differing pasture intensities

³⁾ includes agricultural management categories such as different residue addition levels and differing tillage systems and agricultural use of organic soils

no land-use change

Unresolved in the present greenhouse inventory guidelines

proposed for further revision of GHG guidelines
(GPG completed)

Land-use change

— Afforestation, reforestation, abandonment of managed land (incl. natural revegetation of fallow land and agricultural set-aside)

..... Forest and grassland conversion (includes deforestation and clearing of native vegetation e.g. wetlands)

Baritz (2004)

Bordeaux, 2004

Forest Soils and CO₂

Rainer Baritz

➤ C sinks in the Kyoto Protocol

Sinks form “RMU’s”: tradable, but not “bankable”

Art. 3.3

Afforestation, deforestation, reforestation (ARD activities)

Land use change, avoided deforestation?, biodiversity?

Art. 3.4

Management of domestic land

- Forest land management: 3.3-sources and CAP

- Cropland, grazing land management, revegetation: “NET-NET”

Ancillary effects, biodiversity?

Art. 6 Joint implementation

activities: human-induced, additional?

Art. 12 CDM

only ARD: human-induced, additional, baseline?

only plantations, no protection of existing forests

Compiled by Freibauer 2003

➤ **UN ECE Ministerial Conference on the
Protection of Forests in Europe (MCPFE)**

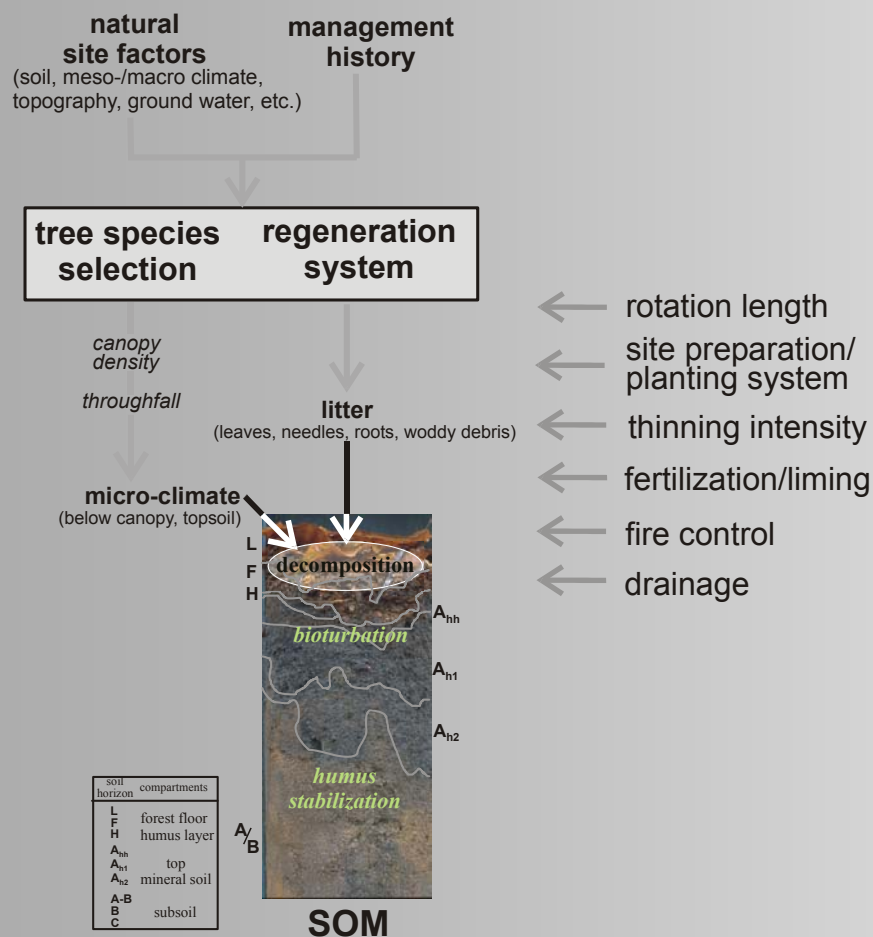

Criteria and indicators

Forest Soils and CO₂

Rainer Baritz

➤ EU Soil Protection Policy: Soil Thematic Strategy

- e.g.: Soil Organic Matter and Soil Biodiversity (all land uses)

Requirements:

- **Cross-country** soil monitoring data
- Common **baseline** (soil GOOD STATUS)
- **Comparable** and **verifiable** data
- Coverage of soil **threats** (hot spots, landscapes)
- Relationship to **management**
- etc.

Forest Soils and CO₂

Rainer Baritz

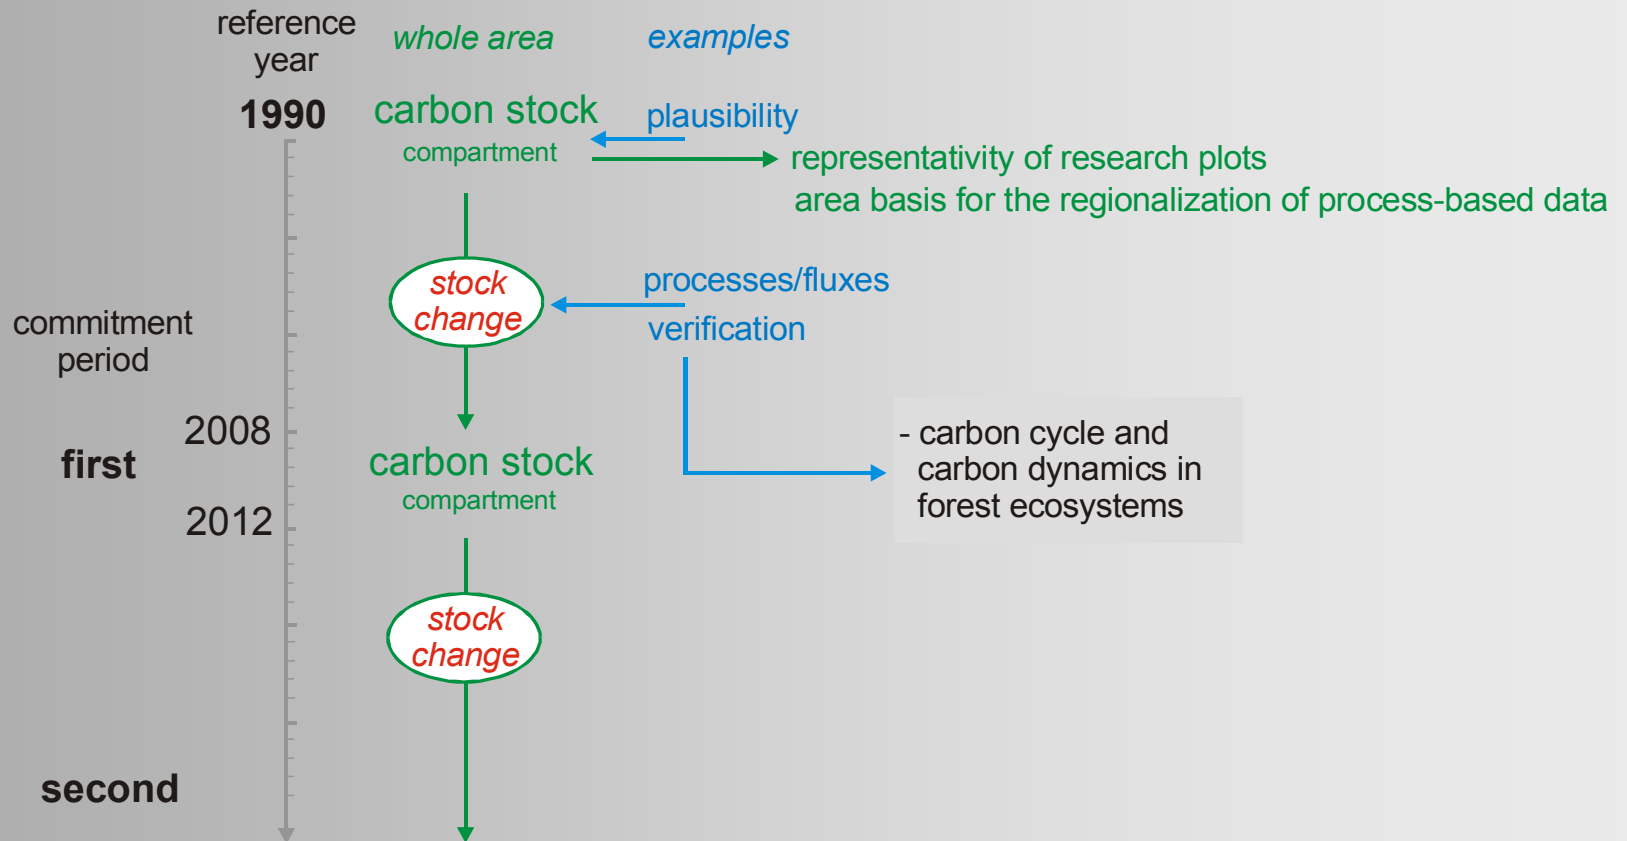

➤ Research to provide data to policy

- national inventory data
- national and European monitoring networks

CarboInvent

CarboEurope

- 36 research plots throughout Europe

- methodical framework for carbon accounting systems
- regional level
 - national level
 - European level

Forest Soils and CO₂

Rainer Baritz

Research Response

Forest Soils and CO₂

Rainer Baritz

➤ numerous projects....

Forest Soils and CO₂

Rainer Baritz

➤ CO₂ - dynamics

CO₂ - sinks

photosynthetic CO₂-fixation

Drivers

soil moisture, temperature, CO₂ (atmosphere), nutrient availability, pollutant input, solar radiation, soil physical and soil chemical properties, forest management

CO₂ - sources

auto- and heterotrophic respiration

Drivers

soil moisture, temperature, CO₂ (atmosphere), nutrient availability, pollutant input, physical and chemical soil properties, forest management

Problems

- measurement intensive and expensive
- not representative
- high spatial and temporal variability
- lack of regional estimates
- DOCs not fully considered (depth gradient)
- root dynamics not fully considered
- long-term measurements required

➤ CO₂ - dynamics

C - pool

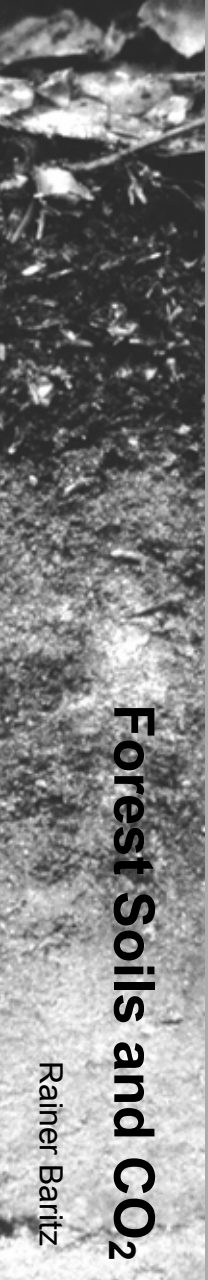

C concentration, C stocks (C content, C density)

Drivers

- same as for CO₂ sinks and sources
- analysed inventory data are controversial

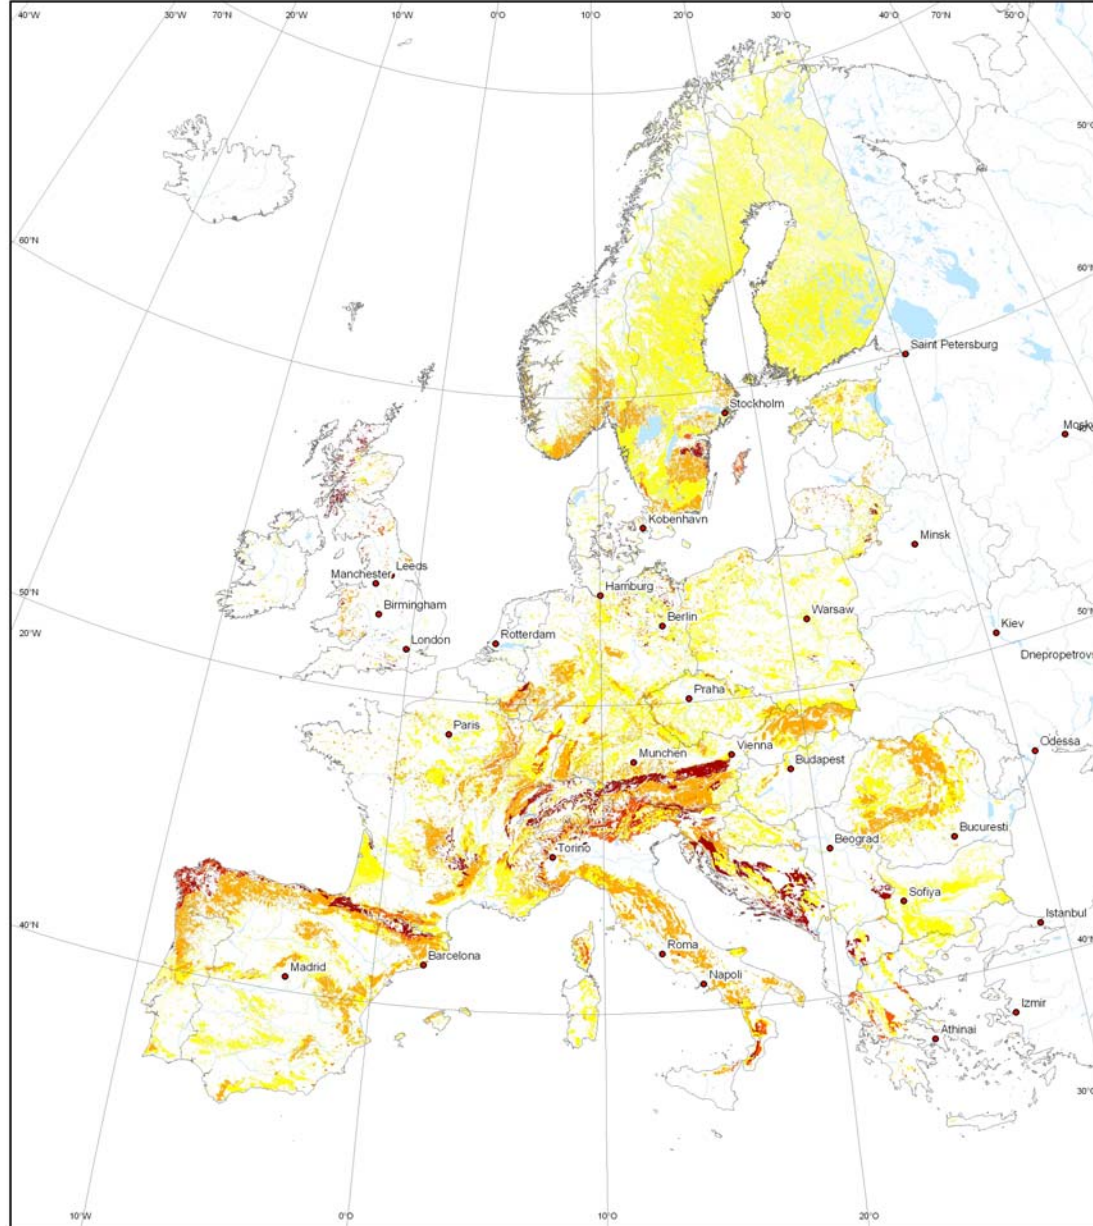

Problems

- environmental gradients not always clear (e.g., temperature northern Europe, elevation)
- also not representative
- also high spatial and temporal variability (forest floor, litter)
- not all pools can be reliably measured (e.g., roots)
- high systematic error in soil inventories prevents reliable estimates
- lack of data on DOC prevent complete soil C estimates
- data availability for model input insufficient (e.g., labile vs. stable organic fractions)
- many models can meanwhile predict topsoil C densities fairly well, but not in deeper soil horizons (Yasso, CoupModel, ROMUL) (therefore soil C changes cannot be predicted, especially for Podzols)

Forest Soils and CO₂

Rainer Baritz

“Representativity”

➤ Systematic error

Example: Stones

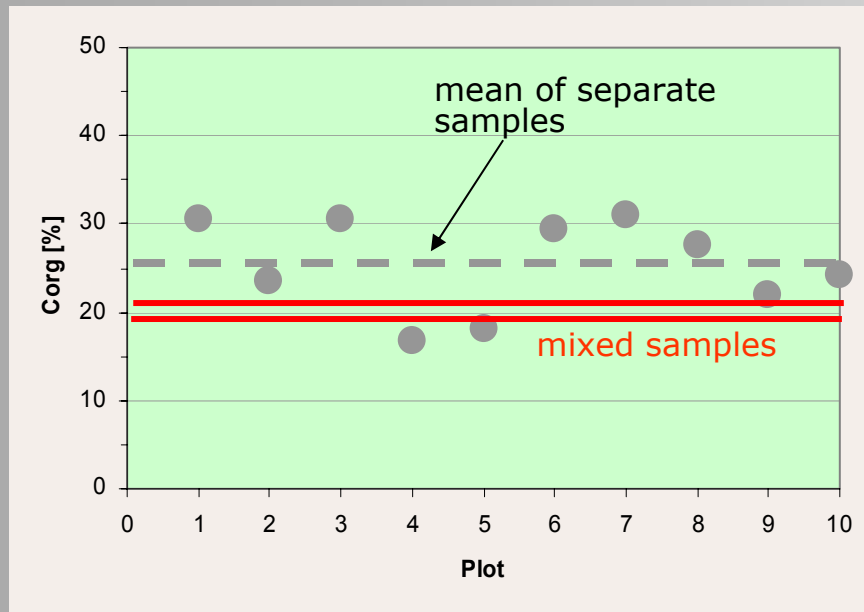

Wirth et al. 2003

➤ Systematic error

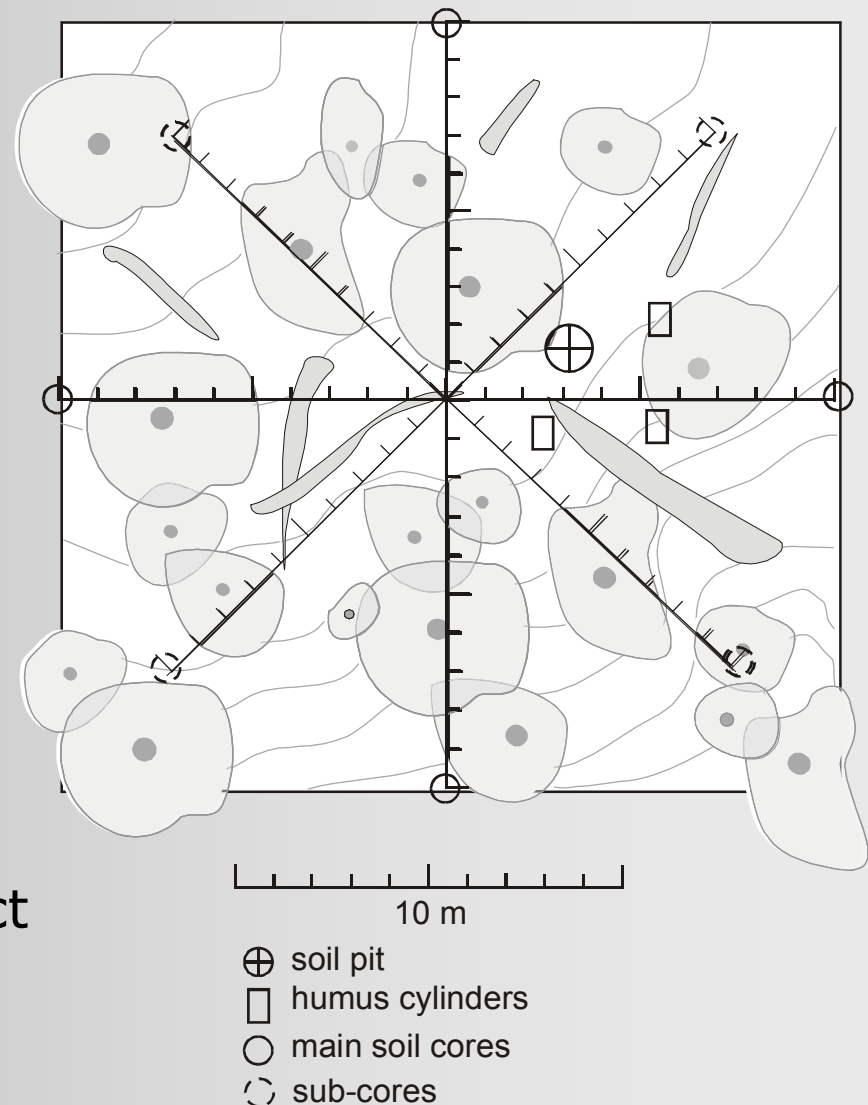

Example: representative, plot level sampling design

Baritz (2003, unpublished)

Spatial variability in 10m transect

Corg [wet oxidation], H horizon

➤ Climate change

Temperature: increase by 1.4 to 5.8°C until 2100

Soil moisture: increase of weather extremes (summer drought, floods, fire)

CO₂ (atmosphere): 540 to 970 ppm until 2100

Calamities

Disturbance

Management change

Change of deposition regime

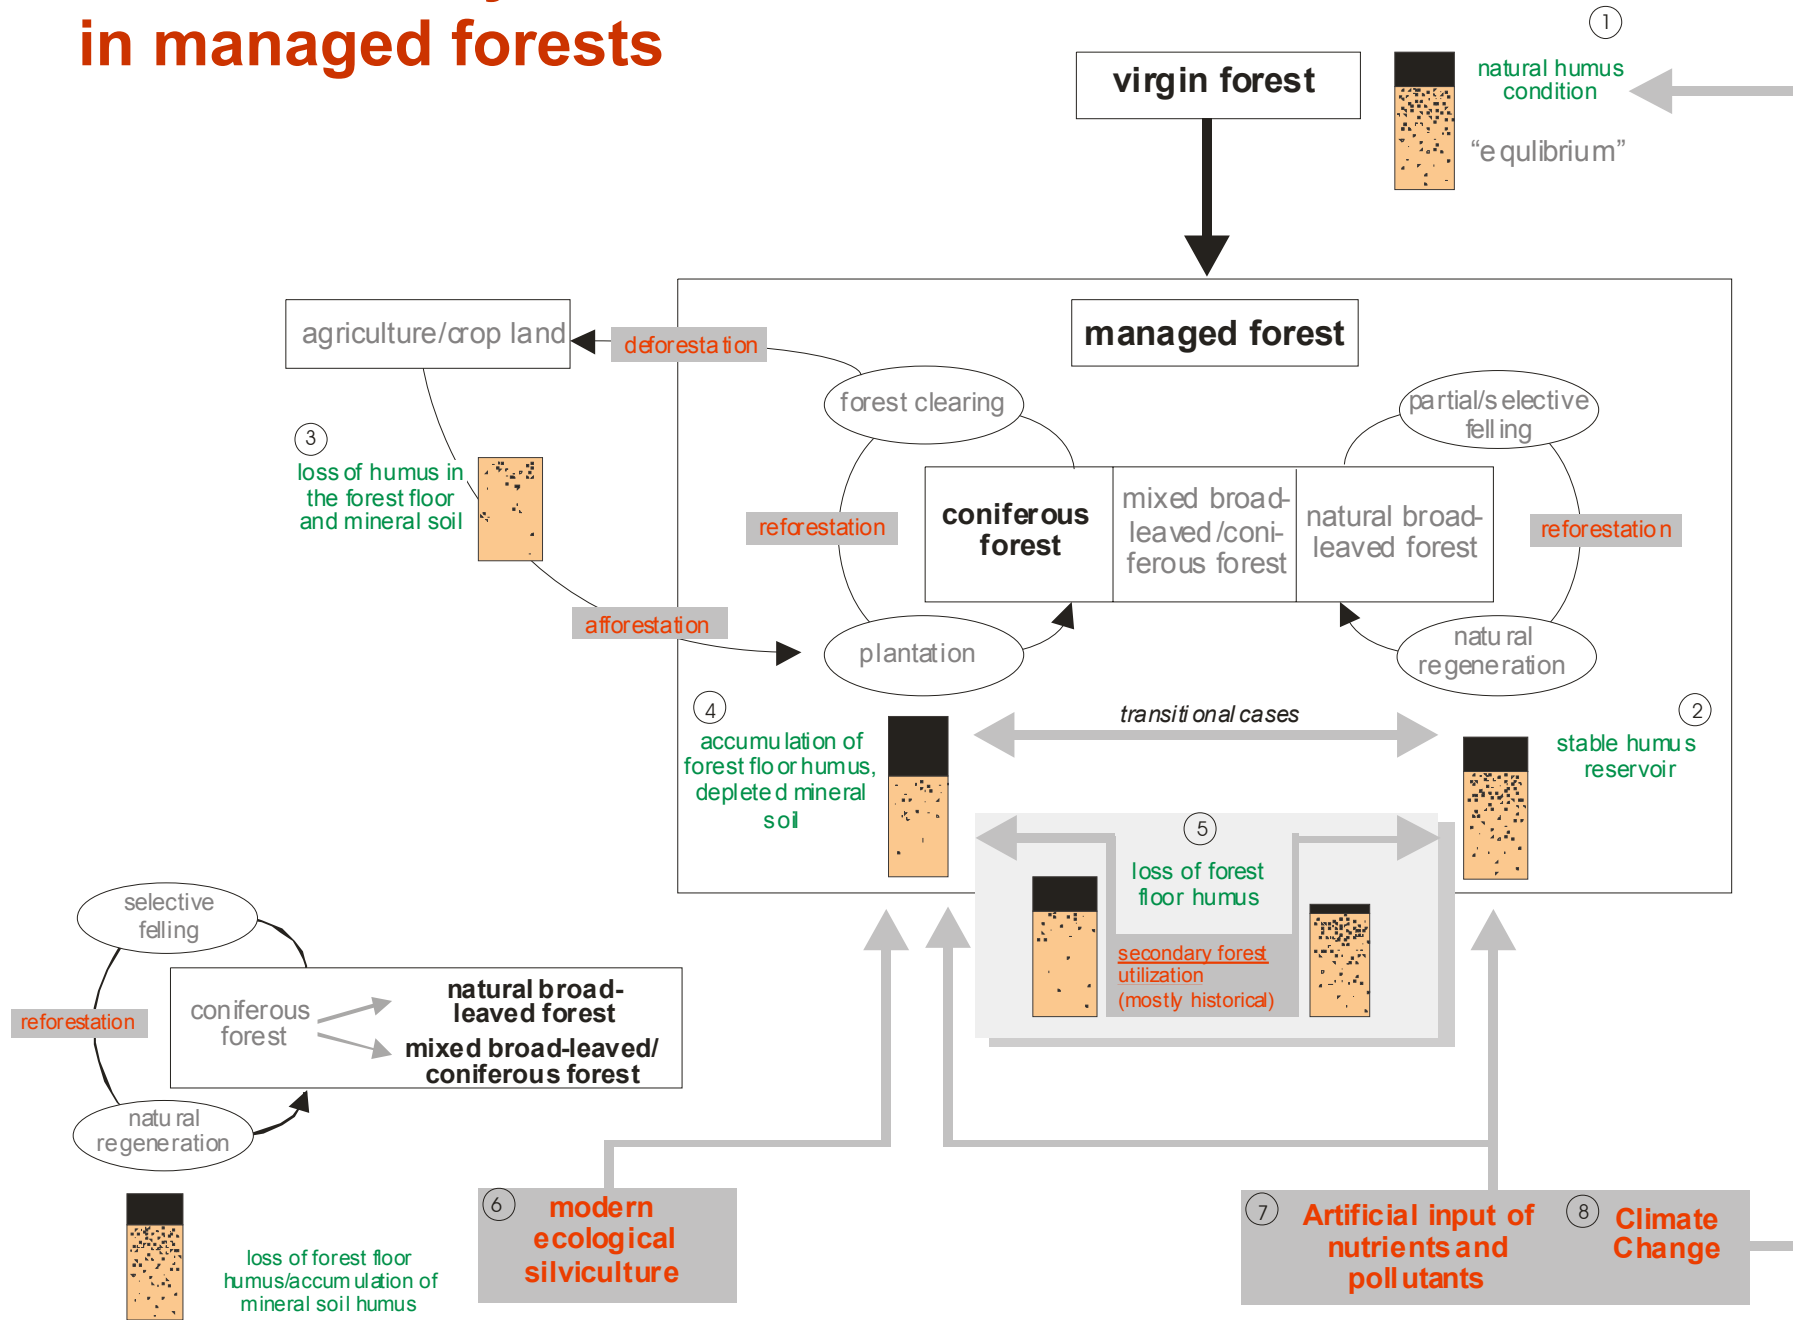

Almost all drivers of the C and N cycle are expected to change!

Forest Management

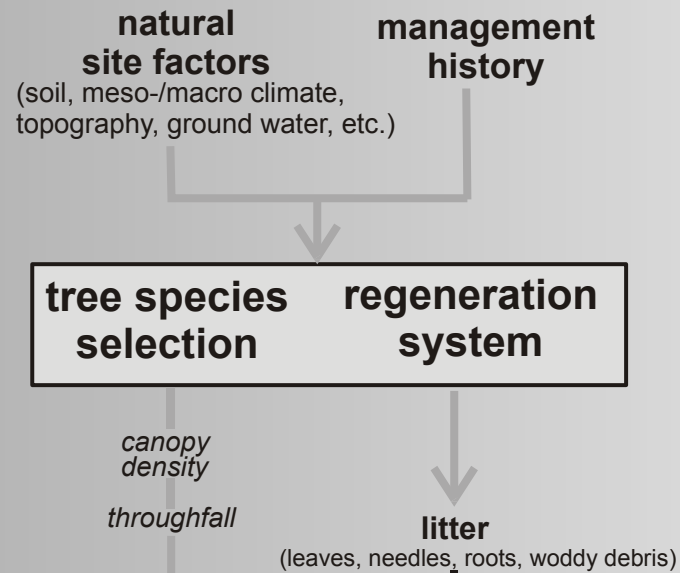

Forest Soils and CO₂

Rainer Baritz

➤ Soil carbon dynamics in managed forests

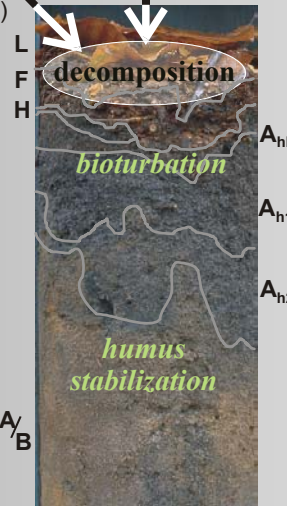

➤ Management Types: TWG SOM

- ← rotation length
- ← site preparation/ planting system
- ← thinning intensity
- ← fertilization/liming
- ← fire control

A _{h1}	
A _{h2}	mineral soil
A-B	
B	subsoil
C	

SOM

Forest Soils and CO₂

Rainer Baritz

➤ Management Types: TWG SOM

SOM content	Bio-diversity	Farm economy	N ₂ O emission
-------------	---------------	--------------	---------------------------

Land use change

arable – permanent pasture	+	+ (1)	–	+
permanent pasture – arable	–	– (1)	+	–
arable – forest <i>incl. bioenergy crops</i>	+	+	–	–
forest – arable	–	–	+	+
set aside (<i>natural revegetation</i>)	+	+	<i>subsidized</i>	–

Agricultural land use practices

pasture: grazing intensity ↑	+/-	–	+	+
pasture: grazing – mowing	–	?	+ ?	-
mineral fertilization	+?	–	+	+
organic fertilization	+	+	+	+
conservation tillage	+	+	??	+
maximise soil cover (<i>green manure</i>)	+	+	+	?
maximise use of crop residues	+	+	+	+
irrigation	<i>effects are highly variable: soil type, crop, degree of salinisation, sensitivity to erosion and compaction</i>			
organic farming	+	+	(2)	
decrease drainage	+	+	–	– (–?) (3)
buffer strips	+	+	–	–
peatland management	<i>effects mostly relate to the regulation of drainage</i>			

Forestry

forest preservation	+	++	–	0
natural regeneration	+	+	+	0
plantation forestry	(–)	(+)	++	(–)

(1) Depending on intensity of pasture management

(2) Depending on degree of internalization of all costs for all farming systems

(3) Effects on CH₄ also need to be considered

Conclusions

Data basis

- not representative
- soil inventory do not meet model (and C and N cycle) requirements
- Long term measurements and higher amount of trace gas measurements needed
- high systematic error
- models do not sufficiently account vertical C „re-“distribution

Research

- soil inventory and flux research insufficiently coupled (→ cooperate with CarboData platform)
- enormous amount of domestic and international research
- policy demand clearly formulated
- careful site description/management type/historical land use required for every research plot!
- Improved description of humus type and soil water regime needed as well
